1989 POPULATION ESTIMATES FOR UTAH AND ITS COUNTIES

Brad T. Barber and Jeanine M. Taylor*

According to the estimates from the Population Estimates Committee, the population of Utah reached 1,715,000 as of July 1, 1989, which represents an increase of 20,000, or 1.2 percent over the 1988 figure of 1,695,000. Utah's estimate includes the preliminary natural increase of 26,633 persons, and an implied net out-migration of over 6,300. Although Utah's population has increased in each year of the 1980's, the growth occurred from 1980 to 1988 at a decreasing rate. This year marked the first year during the 1980's that the population growth rate has increased over the previous year. The U.S. population increase was estimated to be 1.0 percent for 1989.

Among Utah's 29 counties, 17 gained population from 1988 to 1989. Five counties declined in population while seven remained unchanged. Most of Utah's population increase occurred in three of the Wasatch Front Counties: Davis, Salt Lake and Utah. Salt Lake County increased by 7,000, Utah County by 5,000 and Davis County by 3,000. These three counties accounted for 75 percent of the total growth in the state. Washington County continues to lead all counties in rate of growth with a population increase of 4.9 percent, followed by Summit and Morgan Counties at 4.5 and 2.6 percent respectively.

Natural increase, which is the measure of births minus deaths, was the second lowest number since 1976. The period from July 1, 1988 through June 30, 1989, showed a slight decrease (0.3 percent) in births, compared to the previous 12 months. Deaths during the same period also decreased from 9,122 to 8,916 -- a 2.3 percent decline. This resulted in a fairly constant overall natural increase as compared to the previous year.

Utah continued to experience net out-migration in 1989, though at a lower level than the previous four years. The out-migration trend has now continued for six years. Because of 1989's healthy economic performance, continued out-migration is perplexing. The best explanation appears to be that many of the new jobs created are not household sustaining, do not attract workers from out-of-state, or keep people from looking in other states for employment. The out-migration phenomenon is as

*Brad T. Barber is director of the Demographic and Economic Analysis (DEA) section of the Utah State Office of Planning and Budget, and chairman of the Utah Population Estimates Committee; Jeanine M. Taylor is an economist, DEA, Office of Planning and Budget.

much a product of prosperity in other states as it is a problem in Utah's own economy. Although Utah is experiencing good growth, many other areas in the West are also growing well and can sometimes offer Utah workers higher wages. The net out-migration in 1989, however, is approximately 6,300, significantly less than the 11,500 experienced last year. The 1989 state rate of out-migration was 0.4 percent, which means that the excess "out-movers" over "in-movers" amounted to 0.4 percent of the 1988 population. This is almost half the rate of out-migration that occurred in the previous year.

The rate of out-migration was once again highest in Utah's rural counties, led by Daggett, Duchesne, Uintah and Rich. In fact, many of these counties had net out-migration which exceeded natural increase, resulting in a decline in the total population. However, only half as many counties had a net decline in population as compared to 1988.

It is customary for the Population Estimates Committee to revise the previous year's estimate in order to reach a consensus with the U.S. Bureau of the Census at the state level. However, it was the decision of the Committee that the estimate produced by the Bureau of the Census for 1988 varied too significantly from the Committee's estimate and a revision would distort growth trends. Therefore, no revision was made. These differences with the Bureau of the Census will not be long lasting, as the decennial census is but a few months away. Also it should be noted that numerous differences occur between the Population Estimates Committee's county estimates and those of the Bureau of the Census.

Figure 1 presents the percentage changes in population for each of the counties from 1988 to 1989. Figure 2 displays the percent change in population by county for the period 1980-1989. Table 1 offers the revised and preliminary population estimates by county, multi-county districts (MCD) and metropolitan statistical areas (MSA) for 1980 through 1989. Table 2 presents total natural increase and total "residual" net migration by county for the 1980-1989 period, along with the past two individual years. Table 3 offers births, deaths and natural increase for calendar and fiscal years 1970 through 1988-1989; while Table 4 shows the population density for each county for 1980, 1988 and 1989. Table 5 presents the derivation of the Committee's preliminary July 1, 1989 estimates based upon the 1988 state population total.

Growth in the 1980's

The population estimate for Utah was 1,474,000 as of July 1, 1980. Since that time, the population has

grown by approximately 241,000 persons, which translates into a 1.7 percent average annual growth rate for the 1980's. This rate compares to the national average annual growth of 1.0 percent for the 1980's.

Population change over time is a result of two phenomena: 1) natural increase, or births minus deaths; and 2) net migration. As stated earlier, the total increase in population in the state for the 1980's has been due to natural increase; however, the following is a brief description of population change in the 1980's on the county level. These population changes, increases and decreases, are a result of adding natural increase plus net (either in or out) migration to the 1980 population base. Figure 2 displays the total percent changes in county population for the period 1980-1989.

The first three years in the 1980's showed net in-migration, while the last six years have shown net out-migration. Natural increase totalled 265,492 for the past nine years. Given the population increase of 241,000, there is an implied "residual" net out-migration, over the past nine years, of over 24,000 persons. In other words, the residual of total population change minus natural increases equals net migration. Net out-migration occurs when the total observed change in population is smaller than the natural increase alone. Net in-migration occurs when the observed population change is greater than that measured by natural increase alone.

Although the four metropolitan counties -- Davis, Weber, Salt Lake and Utah -- accounted for almost 78 percent of the population growth in the state in the last nine years, all of the increase was due to natural increase. The natural increase for the four counties was 207,596 while the increase in the population was 187,000. This implies a net out-migration of almost 20,600 persons for the four counties.

In terms of net migration, Washington, Davis, Millard, Summit and Cache had net in-migration of over 1,000 persons for the nine-year period, while 11 counties had net out-migration of over 1,000 persons for the same period. This does not necessarily mean that there is a net decrease in population; that will happen only if net out-migration is greater than natural increase. Total net migration by county for the last nine years as a percent of each county's 1980 population estimate is presented in Figure 3.

Organization and Procedure

Coordination and staffing of the Utah Population Estimates Committee is the responsibility of the Demographic and Economic Analysis (DEA) Section of the Utah Office of Planning and Budget. The Committee's estimates represent the official estimate for

the state and its counties. A listing of Committee members appears on the last page of this article.

The Committee's participation in the Federal-State Cooperative Program for Local Population Estimates provides for an exchange of data with the federal government and an opportunity to improve the quality of the state and county estimates by both parties.

Methodology for Estimating Population

For the past several years, the Utah Population Estimates Committee has utilized two population estimating methods -- school enrollment and L.D.S. Church membership -- in calculating its state and county estimates. At its November and December 1989 meetings, the Committee reviewed the population estimates derived from these two methods. Employment and new utility connection data were used as supplemental data to the estimates to assure consistency.

The 1990 Census will provide the data needed to evaluate the methodologies used for the intercensal years, 1981-1989. A complete study of the methodologies will be completed as soon as population data are received in early 1991.

School Enrollment Method

The school enrollment method utilizes data from Fall 1989 school enrollment changes as an indicator of net migration, along with fiscal year 1989 birth and death records as a measure of natural increase. The Utah Population Estimates Committee, like the Bureau of the Census, relies heavily upon school enrollment data as an indicator of migration. Since the state does not collect migration statistics, it is important to note that these migration numbers are derived estimates -- they are not an actual count.

The school enrollment method compares a county's survived enrollment (calculated by applying survival rates to the enrollment count) in grades 1-8 for October 1988, to grades 2-9 for October 1989. The difference between these two enrollment totals is taken to be net student migration for the county. Total net migration for the county is then derived by multiplying the county's student migration estimate by the county-specific total population-to-student ratio. This ratio is defined as the total population estimate of the county for 1988 divided by the 1988 grades 1-8 school enrollment.

The second component of the school enrollment method is the calculation of natural increase in the county. Natural increase for any year is defined as the number of births minus the number of deaths. The 1989

population estimates are determined, in part, by the number of resident births and deaths that occurred from July 1, 1988 to June 30, 1989. The count of births and deaths occurring to Utah residents for the fiscal year 1989 can be found in Table 3.

Preliminary births in fiscal year 1989 were 35,549, a slight decrease from 1988, but still the second lowest number of births since 1976. The crude birthrate (births during the calendar year per 1,000 population on July 1) has dropped from 28.3 in 1980 to 21.0 in 1988, while the U.S. crude birthrate held virtually constant: 15.9 in 1980 and 15.7 in 1988. The total number of deaths, with few reversals, has increased each year since 1980. However, deaths per 1,000 population have stayed fairly constant -- 5.5 per 1,000 population in 1980 and 5.4 per 1,000 population in 1988.

The school enrollment method, as described above, is limited in estimating migration among the retired, college students, single persons and other groups that are not represented in school enrollment estimates.

L.D.S. Membership Method

The L.D.S. Church annually audits its records and enumerates the members residing in each county of the state. The Committee uses this information to produce a set of county-level population estimates. The L.D.S. membership method uses a total population to L.D.S. membership ratio which is obtained by dividing 1988's population by the 1988 L.D.S. membership. This ratio is applied to the current L.D.S. membership to obtain a county population estimate. This method is relatively accurate in areas with high proportions of L.D.S. membership and low migration rates.

Local Coordination

At the Committee's December 1989 meeting, the preliminary 1989 county and state population estimates were reviewed and approved. The respective county estimates were then sent to each county commission and to the seven Associations of Government for review and comment. A number of telephone calls were received and there will be an investigation of several issues raised as a result of these communications. The local coordination effort is an important component of the estimation process. Although there will always be small differences between the Committee's estimates and estimates developed by local governments, it does assure the Committee that no major problems exist. The Committee is dedicated to keeping local governments informed of changes in estimation data and procedures.
